

White's Treefrog Care Sheet

Common Name: White's Treefrog, Dumpy, Smiling, or Australian Green Tree Frog

Latin name: *Litoria caerulea*

Native to: Northeast Australia, New Guinea, Indonesia and the Torres Straits

Size: White's tree frogs average 4 inches for males and 5½ inches for females

Life span: 20 years plus

General appearance: The White's tree frog has a smooth green rubbery skin (can turn brown occasionally or have whit speckles) and has a fat and flabby appearance. At one year of age, breeding males grow nuptial pads (puffy pads where their "thumb" and "palm" meet). White's tree frog tadpoles are large, 1¾ - 4 inches (45 - 100 mm), dark green or dark gray-green in color.

Enclosure: Larger is better for this species, a minimum of 25 gallons for an adult pair is recommended. An arboreal enclosure is the best choice, as White's tree frogs will spend most of their time being high in the enclosure. Plants and hollow logs/branches provide shelter and security. Can be safely housed with other White's tree frogs or with other similar sized tree frogs.

Temperature: Temperatures should be up to 86° F (30° C), but can be reduced to 68° F- 75° F (20° C) at night.

Heat/Light: White's tree frogs are nocturnal. There is no specific lighting requirements. Live plants will require a full spectrum light. An under tank heater can be used but do not use heat rocks.

Substrate: Potting soil or peat moss on the bottom. Avoid using small bark and gravel due to danger of ingestion.

Environment: Semi-tropical - A moderate amount of humidity is required. This can be achieved through misting of the tree frogs and enclosure two or more times a day. Additionally a large water dish with a depth of about four inches is required.

Diet: White's tree frogs are insectivores. They will eat crickets, cockroaches, locusts, moths and beetles. Dust crickets with calcium & vitamins 3 once a week. Check all crickets are gone before offering more. They are known for overeating and obesity. Fat is stored in the supratympanic ridges. An oblast frog's supratympanic ridges will cover the tympanic membrane ("ear") Feed only what is consumed in a few minutes.

Maintenance: Remove dead insects and clean water bowl several times a week or as needed, but no less than weekly. Regular handling should be avoided. Hands must be washed and rinsed prior to touching the frog and should remain wet.
